

HOW WE BUILT A DUAL-MARKET TRADING PLATFORM CONNECTING CRYPTO AND EQUITIES IN ONE EXPERIENCE

Quantiva Nexus LLC set out to end the two-app problem in retail trading. We designed and engineered Quantiva HQ, a mobile and web trading platform that links a trader's own crypto exchange and stock brokerage accounts, scores every signal, and places the order without leaving the screen it appeared on. It is live on the App Store, Google Play and the web.

PRODUCT STRATEGY UI / UX MOBILE & WEB API INTEGRATIONS KYC & BILLING

THE PRODUCT

ONE TRADING TERMINAL THAT REFUSES TO PICK A SIDE

Retail traders who hold both crypto and equities normally run two apps, two logins and two mental models. Almost every app in the category picks a side and tells the user to go elsewhere for the other half of their portfolio.

Quantiva HQ links a user's existing exchange and brokerage accounts by API and never takes custody. It scores live market news and signals, and lets the trader approve and place the order in the same session.

The product could not launch as an MVP that did one market well. A KYC pipeline, per-user risk controls, pooled-capital VC Pools, an on-chain rewards token on Base and a nine-SKU subscription system all had to be live in version 1.0, approved by two app store review boards in a regulated 18+ finance category.

Crypto mode. Same account, same layout, same components.

Stocks mode. Portfolio, recommendation and insights repopulate from the other market.

THE CHALLENGE

TWO MARKETS, TWO TOOLCHAINS, AND A COMPLIANCE WALL IN FRONT OF BOTH

Crypto lives on exchanges like Binance and Bybit. Equities live at brokerages like Interactive Brokers and Alpaca. The account models, order types, settlement and regulation all differ. Four problems compounded.

INTEGRATION BREADTH

Eight third-party venues, each with its own API, authentication, symbol conventions and rate limits, resolving into one portfolio view.

REGULATORY GATING

Country selection, risk disclosure, an 18+ gate and identity verification all had to precede first use.

TWO ARCHITECTURES, ONE SHELL

Crypto and equities need different dashboards and signal framing, without feeling like two apps bolted together.

REVENUE FROM DAY ONE

Subscription billing across three tiers and three cycles, store-compliant, live in v1.0.

UNIFY BOTH MARKETS

Shipping crypto-only would have made it just another exchange client.

CONNECT, DON'T CUSTODY

Capital never leaves the venue the user already trusts.

SIGNAL TO ORDER

Every card carries a Trade action that raises the ticket in place.

RISK IN THE USER'S HANDS

Limits the user can see and set, before anything is automated.

WHAT WE BUILT

01 / 06

ONE COMPLIANCE GATE AND FOUR PERSISTENT SURFACES

Rather than modelling the app around asset classes, we modelled it around what a trader does in a session: get admitted, check the book, read the market, decide, execute and manage. Sixty-six screens resolve into four destinations.

02 / 06

ONE CONNECTION FLOW FOR TWO FINANCIAL SYSTEMS

After verification, one screen presents both crypto exchanges and stock brokerages as collapsible sections, with recommended combinations that pair a named exchange with a named brokerage. A user with accounts at two kinds of venue links both in a single sitting, without learning the difference between an exchange API and a brokerage API.

The dashboard then puts a Crypto / Stocks control at the very top. Switching it swaps the entire data model while navigation, hierarchy and components stay identical.

03 / 06

RESEARCH THAT IS ONE TAP FROM EXECUTION

The live feed carries per-asset filters and a visible source and timestamp on every item. Attribution is deliberate: in a category full of unsourced signal spam, showing where information came from is a trust mechanism.

The decisive detail is the Trade button on every card. The order ticket opens in place, supports Buy and Sell across limit, market and stop-limit, and shows the running total before a single Approve Trade action. A setup read at 09:41 can be acted on at 09:41.

04 / 06

AUTOMATION WITHOUT A SCRIPTING LANGUAGE, AND RISK AS A REQUIRED FIELD

Automated trading is normally gated behind rigid presets or code. A three-step builder sets assets, timeframe, market type and entry conditions, then exits, then filters and a backtest before activation.

Step two makes position sizing and per-trade risk required before the strategy can even be named. A user who never opens an advanced panel is exactly the user most exposed by its absence.

STEP 1	Assets, timeframe, market type and entry conditions.
STEP 2	Take profit, stop loss and mandatory risk management.
STEP 3	Filters, notifications, preview and backtest.

05 / 06

COMPLIANCE AND SECURITY BUILT IN FROM VERSION 1.0

Retrofitting KYC into a live financial product means re-verifying an existing user base and risking removal from both stores. Verification runs on SumSub as a tracked, resumable four-part pipeline, so a hard stop becomes a progress bar. A user who cannot photograph a document immediately can leave and return.

Because the app holds API access to venues where real capital sits, users get session-level control: two-factor authentication, new-device alerts, and every active session listed with location and independently revocable.

06 / 06

ENTITLEMENTS ENFORCED IN THE PRODUCT, NOT JUST ON THE PRICING PAGE

Feature access is gated at the surface level throughout the application, and each gate explains which tier unlocks it. Free-tier usage is metered and visible before the limit is hit. An on-chain rewards token on Base closes the loop between store billing, the trading engine and a user's own wallet.

FOUR TIERS, ENFORCED PER FEATURE

FreeBoth dashboards, AI Insights feed, 5 signal trades \$0

ProUp to 5 custom strategies, automated execution \$19.99/mo

EliteUnlimited strategies, VC Pool access \$79.99/mo

Elite PlusOptions trading, Greeks analytics \$119.99/mo

Prices shown are the monthly entry price for each paid tier, read from the App Store in-app purchase list. Quarterly and yearly cycles are also live, for nine subscription SKUs in total.

The subscription screen carries five tabs, including usage analytics and per-trade fee visibility, the two tabs most subscription products omit.

RESULTS & IMPACT

A COMPLETE FINANCIAL PRODUCT, LIVE IN PRODUCTION

Quantiva HQ shipped as a working system, not a shell. Every outcome below can be observed in the public store listings or the running application.

5	Delivery surfaces iOS, Android, macOS on Apple silicon, visionOS and a full web application, with the same two market modes on each.	66	Mobile screens 63 phone layouts and 3 iPad Pro compositions across 39 named flows.
8	Connectivity sources Seven execution venues linked by API without custody, plus market data feeds behind the signal engine.	4 tiers	Enforced entitlements Free, Pro, Elite and Elite Plus, gated per feature with free-tier usage metered.
9	Subscription SKUs Live and approved, transacting through Apple billing and Google Play Billing.	2 stores	Approved at launch Cleared review on both stores in a regulated 18+ finance category, with KYC, country gating and risk disclosure from v1.0.

Quantiva HQ is a recent release. Download volume, ratings, revenue, signal accuracy and strategy returns are deliberately not claimed. Nothing here is investment advice, and trading involves significant risk of loss.

WHAT'S NEXT

MOVING FROM A DELIVERY CASE TO AN OUTCOME CASE

These are the measures being collected as the product matures.

KYC FUNNEL COMPLETION
How many users who start verification finish it.

SIGNAL TO ORDER
Median time from a signal surfacing to an order placed.

BOTH MARKETS CONNECTED
Share of users who link a crypto and an equities venue.
